

2.4 Navigating Streams

This tutorial introduces Microsoft Streams and some of its features. All content recorded on Teams automatically syncs with Streams, so it is highly recommended you familiarize yourself with it.

STEP 1

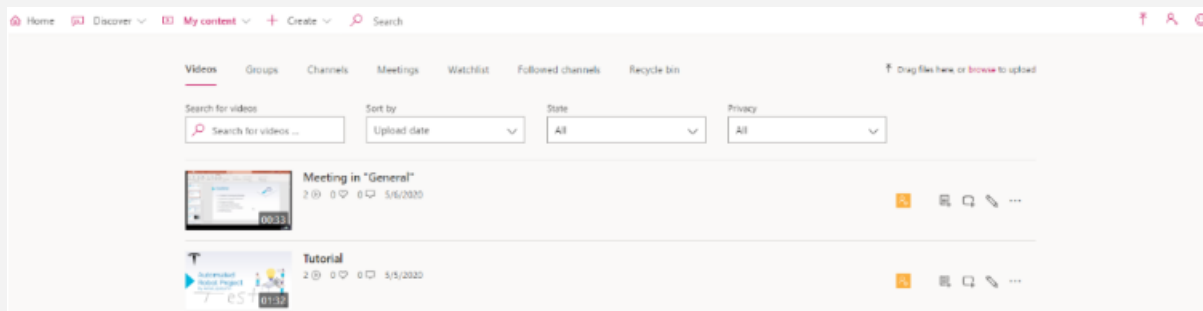

Open Streams and sign in

1 Home button: Select to go back to the homepage of Streams.

2 Discover: Here you can see what other people have uploaded, this button isn't very important.

3 My content: This is an important section of Streams. Here you can see all the videos you've uploaded, your groups, your channels, and other features. Always refer to **My Content** --> **Videos** to see what you have uploaded to streams

4 Create: Here you can upload videos from your local computer and create groups and channels. Creating channels is useful for organizing your videos into your classes. You can also directly record your screen from here but there is a 15 minute limit.

The majority of Streams is not of importance, the most important parts to know are navigating to your own content and the create button.
